## **Clique-width**

Let G be a graph, and let t be a positive integer.

A *t*-graph is a graph whose vertices are labeled by integers from  $\{1, 2, ..., t\}$ .

We call the *t*-graph consisting of exactly one vertex v labeled by some integer *i* from  $\{1, 2, ..., t\}$  an initial *t*-graph.

The clique-width cwd(G) is the smallest integer t such that G can be constructed by means of repeated application of the following four operations:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The clique-width cwd(G) is the smallest integer t such that G can be constructed by means of repeated application of the following four operations:

construction of an initial *t*-graph with vertex *v* labeled by *i* (denoted by *i*(*v*)),

The clique-width cwd(G) is the smallest integer t such that G can be constructed by means of repeated application of the following four operations:

construction of an initial *t*-graph with vertex *v* labeled by *i* (denoted by *i*(*v*)),

• disjoint union (denoted by  $\oplus$ ),

The clique-width cwd(G) is the smallest integer t such that G can be constructed by means of repeated application of the following four operations:

- construction of an initial *t*-graph with vertex *v* labeled by *i* (denoted by *i*(*v*)),
- disjoint union (denoted by  $\oplus$ ),
- relabel: changing the labels of each vertex labeled *i* to *j* (denoted by  $\rho_{i \rightarrow j}$ ), and

The clique-width cwd(G) is the smallest integer t such that G can be constructed by means of repeated application of the following four operations:

- construction of an initial *t*-graph with vertex *v* labeled by *i* (denoted by *i*(*v*)),
- disjoint union (denoted by  $\oplus$ ),
- relabel: changing the labels of each vertex labeled *i* to *j* (denoted by  $\rho_{i \rightarrow j}$ ), and
- join: connecting all vertices labeled by *i* with all vertices labeled by *j* by edges (denoted by  $\eta_{i,j}$ ).

An expression tree of a graph G is a rooted tree T:

- the nodes of T are of four types:  $i, \oplus, \eta$  and  $\rho$ ;
- introduce nodes i(v) are leaves of T for initial *t*-graphs with vertices v, which are labeled i;
- a union node ⊕ stands for a disjoint union of graphs associated with its children;
- a relabel node  $\rho_{i \rightarrow j}$  for the *t*-graph resulting from the relabeling operation  $\rho_{i \rightarrow j}$  applied to the child;
- a join node  $\eta_{i,j}$  for the *t*-graph resulting from the join operation  $\eta_{i,j}$  applied to the child;
- the graph G is isomorphic to the graph associated with the root of T (with all labels removed).

An expression tree of a graph G is a rooted tree T:

- the nodes of T are of four types: i,  $\oplus$ ,  $\eta$  and  $\rho$ ;
- introduce nodes i(v) are leaves of T for initial *t*-graphs with vertices v, which are labeled i;
- a union node ⊕ stands for a disjoint union of graphs associated with its children;
- a relabel node  $\rho_{i \rightarrow j}$  for the *t*-graph resulting from the relabeling operation  $\rho_{i \rightarrow j}$  applied to the child;
- a join node  $\eta_{i,j}$  for the *t*-graph resulting from the join operation  $\eta_{i,j}$  applied to the child;
- the graph G is isomorphic to the graph associated with the root of T (with all labels removed).

The width of the tree T is the number of different labels appearing in T.

## **Clique-width**

## **Clique-width**

### Theorem (Courcelle, Makowsky, and Rotics, 2000)

All problems expressible in  $MSO_1$ -logic are fixed parameter tractable (FPT), when parameterized by the clique-width of the input graph. Or in other words, any problem expressible in  $MSO_1$ -logic can be solved, for graphs of clique-width at most t, in time  $f(t) \cdot |I|^{O(1)}$ , where |I| is the size of the input and f is a computable function depending on the parameter t only.

# We obtain the asymptotically tight bounds for $\underline{Max-Cut}$ and $\underline{EDGE}$ $\underline{DOMINATING}$ $\underline{SET}$ by showing that both problems

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

We obtain the asymptotically tight bounds for  $\underline{Max-Cut}$  and  $\underline{EDGE}$   $\underline{DOMINATING}$   $\underline{SET}$  by showing that both problems

• cannot be solved in time  $f(t)n^{o(t)}$ , unless ETH collapses; and

We obtain the asymptotically tight bounds for  $\underline{Max-Cut}$  and  $\underline{EDGE}$   $\underline{DOMINATING}$   $\underline{SET}$  by showing that both problems

• cannot be solved in time  $f(t)n^{o(t)}$ , unless ETH collapses; and

• can be solved in time  $n^{O(t)}$ ,

where f is an arbitrary function of t, on input of size n and clique-width at most t.

We obtain the asymptotically tight bounds for  $\underline{Max-Cut}$  and  $\underline{EDGE}\ \underline{DOMINATING}\ \underline{SET}$  by showing that both problems

• cannot be solved in time  $f(t)n^{o(t)}$ , unless ETH collapses; and

• can be solved in time  $n^{O(t)}$ ,

where f is an arbitrary function of t, on input of size n and clique-width at most t.

Similar results can be obtained for some variants of these problems, e.g., for MAXIMUM (MINIMUM) BISECTION.

We give tight algorithmic lower and upper bounds for some double-parameterized graph problems when the clique-width of the input graph is one of the parameters. We prove the following for n-vertex graphs G of clique-width at most t,

We give tight algorithmic lower and upper bounds for some double-parameterized graph problems when the clique-width of the input graph is one of the parameters. We prove the following for n-vertex graphs G of clique-width at most t,

• The DENSE (SPARSE) *k*-SUBGRAPH problem, can be solved in time  $k^{O(t)} \cdot n$ , but it cannot be solved in time  $2^{o(t \log k)} \cdot n^{O(1)}$  unless ETH fails.

We give tight algorithmic lower and upper bounds for some double-parameterized graph problems when the clique-width of the input graph is one of the parameters. We prove the following for n-vertex graphs G of clique-width at most t,

- The DENSE (SPARSE) *k*-SUBGRAPH problem, can be solved in time  $k^{O(t)} \cdot n$ , but it cannot be solved in time  $2^{o(t \log k)} \cdot n^{O(1)}$  unless ETH fails.
- The *d*-Regular Induced Subgraph problem, can be solved in time d<sup>O(t)</sup> · n, but it cannot be solved in time 2<sup>o(t log d)</sup> · n<sup>O(1)</sup> unless ETH fails.

## **Algorithmic lower bounds**

# Theorem (Cai and Juedes 2001, Downey et al. 2003, Chen et al. 2006)

There is no algorithm for k-CLIQUE (finding a clique of size k) running in time  $f(k)n^{o(k)}$  unless ETH fails.

## **Algorithmic lower bounds**

# Theorem (Cai and Juedes 2001, Downey et al. 2003, Chen et al. 2006)

There is no algorithm for k-CLIQUE (finding a clique of size k) running in time  $f(k)n^{o(k)}$  unless ETH fails.

### Corollary

There is no algorithm for MULTICOLORED k-CLIQUE (finding a clique of size k in a k-partite graph) running in time  $f(k)n^{o(k)}$  unless ETH fails.

## **Capacitated Domination**

### Red-blue Capacitated Dominating Set

## **Capacitated Domination**

### Red-blue Capacitated Dominating Set

## **Capacitated Domination**

#### Problem (Red-Blue CDS)

**Input:** A graph G with a partition (R, B) of V(G), a capacity function  $c \colon R \to \mathbb{N}$  and a positive integer k.

**Question:** Is there a capacitated dominating set  $S \subseteq R$  of size at most k?

## **Capacitated Domination**

### Problem (Red-Blue CDS)

**Question:** Is there a capacitated dominating set  $S \subseteq R$  of size at most k?

**RED-BLUE** SATURATED CDS: each vertex  $v \in S$  is assigned exactly c(v) neighbors to dominate.

RED-BLUE EXACT SATURATED CDS: a variant of Red-Blue Saturated CDS, where |S| = k.

## **Algorithmic lower bounds**

#### Theorem

There is no algorithm for RED-BLUE CDS (RED-BLUE SATURATED CDS, RED-BLUE EXACT SATURATED CDS) running in time  $f(t)n^{o(t)}$  unless ETH fails, where t is the feedback vertex number of an input graph even if the input restricted to graphs G such that

- every minimum feedback vertex set X is independent, and
- only leaves of the forest G X are adjacent to X and each leaf is adjacent to exactly one vertex of X.

## **Algorithmic lower bounds**

#### Reduction for Red-BLUE CDS

・ロト・日本・モート モー うへぐ

## **Algorithmic lower bounds**

#### Corollary

There is no algorithm for RED-BLUE CDS (RED-BLUE SATURATED CDS, RED-BLUE EXACT SATURATED CDS) running in time  $f(t)n^{o(t)}$  unless ETH fails, where t is the clique-width of an input graph/clique-width of the incidence graph of an input graph, even if an expression tree (clique-decomposition) of width at most t is given.

## Lower bound for Edge Dominating Set

#### Theorem

EDGE DOMINATING SET cannot be solved in time  $f(t) \cdot n^{o(t)}$ unless the ETH fails even if an expression tree (clique-decomposition) of width at most t is given.
