$$D_{TV}(t_n + \lambda w_n + o(w_n)) \xrightarrow[n \to \infty]{\mathbb{P}} \Phi(\lambda)$$

Sparse regime: $2 \le d_x^{\pm} \le \Delta$ with Δ fixed as $n \to \infty$

$$\mu := \frac{1}{m} \sum_{x \in \mathcal{X}} d_x^- \log d_x^+, \qquad \sigma^2 := \frac{1}{m} \sum_{x \in \mathcal{X}} d_x^- \left(\log d_x^+ - \mu\right)^2$$

Theorem 1 (cutoff): set $t_n = \frac{\log n}{\mu}$.

$$\mathrm{D}_{\mathrm{TV}}\left(\lambda t_n + o(t_n)
ight) \ rac{\mathbb{P}}{n o \infty} \ \left\{ egin{array}{c} 1 & ext{if } \lambda < 1 \\ 0 & ext{if } \lambda > 1 \end{array}
ight.$$

Theorem 2 (profile): set $w_n = \sqrt{\frac{\sigma^2 \log n}{\mu^3}}$ ($\gg \log \log n$).

$$\mathrm{D}_{\mathrm{TV}}(t_n + \lambda w_n + o(w_n)) \xrightarrow[n \to \infty]{} \Phi(\lambda) = \frac{1}{\sqrt{2\pi}} \int_{\lambda}^{\infty} e^{-\frac{u^2}{2}} \mathrm{d}u$$
