

# Algorithmic High-Dimensional Geometry 2

Alex Andoni

(Microsoft Research SVC)

# The NNS prism

# Small Dimension

# What if $d$ is small?

- ▶ Can solve  $1+\epsilon$  approximate NNS with
  - ▶  $O(nd)$  space
  - ▶  $(O(d)/\epsilon)^d \log n$  query time
  - ▶ [AMNSW'98,...]
- ▶ OK, if say  $d=5$  !
  
- ▶ Usually,  $d$  is not small...

“effectively”

What if  $d$  is small?

▶ Eg:

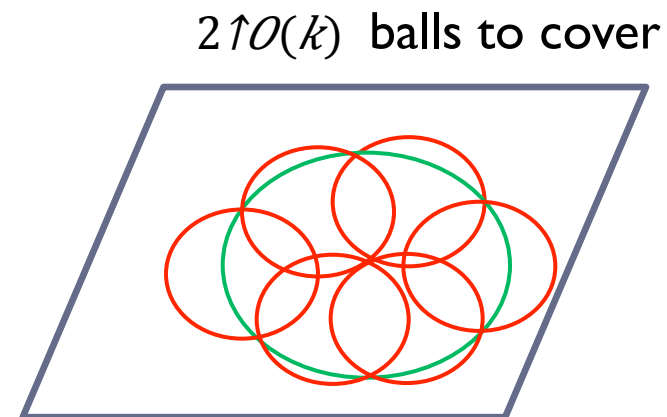

- ▶  $k$ -dimensional subspace of  $\mathbb{R}^d$ , with  $k \ll d$
- ▶ Obviously, extract subspace and solve NNS there!
- ▶ Not a robust definition...

▶ More robust definitions:

- ▶ KR-dimension [KR'02]
- ▶ Doubling dimension [Assouad'83, Cla'99, GKL'03, KL'04]
- ▶ Smooth manifold [BW'06, Cla'08]
- ▶ other [CNBYM'01, FK97, IN'07, Cla'06...]

# Doubling dimension

- ▶ **Definition:** pointset  $S$  has *doubling dimension*  $\lambda$  if:
  - ▶ for any point  $p \in S$ , radius  $r$ , consider ball  $B(p, r)$  of points within distance  $r$  of  $p$
  - ▶ can cover  $B(p, r)$  by  $2^{\lceil \lambda \rceil}$  balls  $B(y_1, r/2), B(y_2, r/2), \dots$
- ▶ **Sanity check:**
  - ▶  $k$ -dimensional subspace has  $\lambda = O(k)$
  - ▶  $n$  points always have dimension at most  $O(\log n)$
- ▶ Can be defined for any metric space!

# NNS for small doubling dimension

## ▶ Euclidean space [Indyk-Naor'07]

- ▶ JL into dimension  $k=O(\lambda)$  “works” !
- ▶ Contraction of *any pair* happens with very small probability
- ▶ Expansion of *some pair* happens with constant probability
- ▶ Good enough for NNS!

## ▶ Arbitrary metric

- ▶ Navigating nets/cover trees [Krauthgamer-Lee'04, Har-Peled-Mendel'05, Beygelzimer-Kakade-Langford'06,...]
- ▶ Algorithm:
  - ▶ A data-dependent tree: recursive space partition using balls  $B(p,r)$
  - ▶ At query  $q$ , follow all paths that intersect with the ball  $B(q,r)$

# Embeddings

# General Theory: embeddings

- ▶ General motivation: given distance (metric)  $M$ , solve a computational problem  $P$  under  $M$

Hamming distance

Euclidean distance ( $\ell_2$ )

Edit distance between two strings

Earth-Mover (transportation) Distance

Compute distance between two points

Nearest Neighbor Search

Diameter/Close-pair of set  $S$

Clustering, MST, etc

$f$

Reduce problem  
< $P$  under hard metric>  
to  
< $P$  under simpler metric>

# Embeddings: landscape

- ▶ **Definition:** an embedding is a map  $f: M \rightarrow H$  of a metric  $(M, d_M)$  into a host metric  $(H, \rho_H)$  such that for any  $x, y \in M$ :

$$d_M(x, y) \leq \rho_H(f(x), f(y)) \leq D \cdot d_M(x, y)$$

where  $D$  is the distortion (approximation) of the embedding  $f$ .

- ▶ Embeddings come in all shapes and colors:
  - ▶ Source/host spaces  $M, H$
  - ▶ Distortion  $D$
  - ▶ Can be randomized:  $\rho_H(f(x), f(y)) \approx d_M(x, y)$  with  $1 - \epsilon$  probability
  - ▶ Time to compute  $f(x)$
- ▶ Types of embeddings:
  - ▶ From norm to the same norm but of *lower dimension* (dimension reduction)
  - ▶ From one norm ( $\ell_2$ ) into another norm ( $\ell_1$ )
  - ▶ From non-norms (edit distance, Earth-Mover Distance) into a norm ( $\ell_1$ )
  - ▶ From given finite metric (shortest path on a planar graph) into a norm ( $\ell_1$ )
  - ▶  $H$  not a metric but a computational procedure ← sketches

# Earth-Mover Distance

- ▶ **Definition:**

- ▶ Given two sets  $A, B$  of points in a metric space

- ▶  $EMD(A, B) = \min$  cost bipartite matching between  $A$  and  $B$

- ▶ **Which metric space?**

- ▶ Can be plane,  $\ell_2$ ,  $\ell_1$  ...

- ▶ **Applications in image vision**

# Embedding EMD into $\ell_1$

- ▶ At least as hard as  $\ell_1$
- ▶ **Theorem [Cha02, IT03]:** Can embed EMD over  $[\Delta]^2$  into  $\ell_1$  with distortion  $O(\log \Delta)$ . Time to embed a set of  $s$  points:  $O(s \log \Delta)$ .
- ▶ **Consequences:**
  - ▶ Nearest Neighbor Search:  $O(d \log \Delta)$  approximation with  $O(s n^{1+1/c})$  space, and  $O(n^{1/c} \cdot s \log \Delta)$  query time.
  - ▶ Computation:  $O(\log \Delta)$  approximation in  $O(s \log \Delta)$  time
    - ▶ Best known:  $1+\epsilon$  approximation in  $O(s)$  time [SA'12]
    - ▶ The higher-dimensional variant is still fastest via embedding [AIK'08]

# High level embedding

▶ Sets of size  $s$  in  $[1 \dots \Delta] \times [1 \dots \Delta]$  box

▶ Embedding of set  $A$ :

▶ take a quad-tree

▶ randomly shift it

▶ Each cell gives a coordinate:

$f(A)_c = \# \text{points in the cell } c$

▶ Need to prove

$$E[\|f(A) - f(B)\|] \approx EMD(A, B)$$

$f(\mathbf{A}) = \dots 2210 \dots 0002 \dots 0011 \dots 0100 \dots 0000 \dots$

$f(\mathbf{B}) = \dots 1202 \dots 0100 \dots 0011 \dots 0000 \dots 1100 \dots$

# Main Approach

- ▶ Idea: decompose EMD over  $[\Delta]^2$  into EMDs over smaller grids
- ▶ Recursively reduce to  $\Delta = O(1)$

$\approx$

+

# EMD over small grid

- ▶ Suppose  $\Delta=3$
- ▶  $f(A)$  has nine coordinates, counting # points in each joint
  - ▶  $f(A)=(2,1,1,0,0,0,1,0,0)$
  - ▶  $f(B)=(1,1,0,0,2,0,0,0,1)$
- ▶ Gives  $O(1)$  distortion

# Decomposition Lemma [IO7]

▶ For randomly-shifted cut-grid  $\mathbf{G}$  of side length  $k$ , we have:

▶  $EEMD_{\Delta}(A,B) \leq EEMD_k(A_1, B_1) + EEMD_k(A_2, B_2) + \dots$   
 $+ k * EEMD_{\Delta/k}(A_G, B_G)$  } lower bound on cost

▶  $EEMD_{\Delta}(A,B) \geq 1/3 E[ EEMD_k(A_1, B_1) + EEMD_k(A_2, B_2) + \dots ]$  } upper bound

▶  $EEMD_{\Delta}(A,B) \geq E[ k * EEMD_{\Delta/k}(A_G, B_G) ]$

▶ The distortion will follow by applying the lemma recursively to  $(A_G, B_G)$

# Part 1: lower bound

▶ For a randomly-shifted cut-grid  $G$  of side length  $k$ , we have:

$$\begin{aligned} \text{EEMD}_{\Delta}(A,B) &\leq \text{EEMD}_k(A_1, B_1) + \text{EEMD}_k(A_2, B_2) + \dots \\ &\quad + k * \text{EEMD}_{\Delta/k}(A_G, B_G) \end{aligned}$$

▶ Extract a matching  $\pi$  from the matchings on right-hand side

▶ For each  $a \in A$ , with  $a \in A_i$ , it is either:

▶ matched in  $\text{EEMD}(A_i, B_i)$  to some  $b \in B_i$

▶ or  $a \in A_i \setminus B_i$ , and it is matched in  $\text{EEMD}(A_G, B_G)$  to some  $b \in B_j$

▶ Match cost in 2<sup>nd</sup> case:

▶ Move  $a$  to center ( $\Delta$ )

▶ paid by  $\text{EEMD}(A_i, B_i)$

▶ Move from cell  $i$  to cell  $j$

▶ paid by  $\text{EEMD}(A_G, B_G)$

# Parts 2 & 3: upper bound

- ▶ For a randomly-shifted cut-grid  $G$  of side length  $k$ , we have:
  - ▶  $EEMD_{\Delta}(A,B) \geq 1/3 E[ EEMD_k(A_1, B_1) + EEMD_k(A_2, B_2) + \dots ]$
  - ▶  $EEMD_{\Delta}(A,B) \geq E[ k * EEMD_{\Delta/k}(A_G, B_G) ]$
- ▶ Fix a matching  $\pi$  minimizing  $EEMD_{\Delta}(A,B)$ 
  - ▶ Will construct matchings for each EEMD on RHS
- ▶ Uncut pairs  $(a,b)$  are matched in respective  $(A_i, B_i)$
- ▶ Cut pairs  $(a,b)$  are matched
  - ▶ in  $(A_G, B_G)$
  - ▶ and remain unmatched in their mini-grids

## Part 2: Cost?

- ▶  $\text{EEMD}_{\Delta}(A,B) \geq 1/3 \mathbb{E}[\sum_i \text{EEMD}_k(A_i, B_i)]$
- ▶ Uncut pairs  $(a,b)$  are matched in respective  $(A_i, B_i)$ 
  - ▶ Contribute a total  $\leq \text{EEMD}_{\Delta}(A,B)$
- ▶ Consider a cut pair  $(a,b)$  at distance  $a-b=(d \downarrow x, d \downarrow y)$ 
  - ▶ Contribute  $\leq 2k$  to  $\sum_i \text{EEMD}_k(A_i, B_i)$
  - ▶  $\Pr[(a,b) \text{ cut}] = 1 - (1 - d \downarrow x / k)(1 - d \downarrow y / k) \leq \|a-b\| \downarrow 1 / k$
  - ▶ Expected contribution  $\leq \Pr[(a,b) \text{ cut}] \cdot 2k \leq 2\|a-b\| \downarrow 1$
  - ▶ In total, contribute  $2 \cdot \text{EEMD}_{\Delta}(A,B)$

# Wrap-up of EMD Embedding

- ▶ In the end, obtain that
  - ▶  $\text{EMD}(A,B) \approx$  sum of EMDs of smaller grids in expectation
  - ▶ Repeat  $O(\log \Delta)$  times to get to  $1 \times 1$  grid
  - ▶  $O(\log \Delta)$  approximation in total!

# Embeddings of various metrics into $\ell_1$

Metric	Upper bound
Earth-mover distance (-sized sets in 2D plane)	[Cha02, IT03]
Earth-mover distance (-sized sets in )	[AIK08]
Edit distance over (#indels to transform $x \rightarrow y$ )	[OR05]
Ulam (edit distance between permutations)	[CK06]
Block edit distance	[MS00, CM07]

$$\text{edit}(\text{banana}, \text{pineapple}) = 2$$

$$\text{edit}(1234567, 7123456) = 2$$

# Non-embeddability into $\ell_1$

Metric	Upper bound	Lower bounds
Earth-mover distance (-sized sets in 2D plane)	[Cha02, IT03]	[NS07]
Earth-mover distance (-sized sets in )	[AIK08]	[KN05]
Edit distance over (#indels to transform $x \rightarrow y$ )	[OR05]	[KN05, KR06]
Ulam (edit distance between permutations)	[CK06]	[AK07]
Block edit distance	[MS00, CM07]	4/3 [Cor03]

# Non-embeddability proofs

- ▶ Via *Poincaré-type inequalities*...
- ▶ [Enflo'69]: embedding  $\{0,1\}^{\uparrow d}$  into  $\ell^{\downarrow 2}$  (any dimension) must incur  $\Omega(\sqrt{d})$  distortion
- ▶ Proof [Khot-Naor'05]
  - ▶ Suppose  $f$  is the embedding of  $\{0,1\}^{\uparrow d}$  into  $\ell^{\downarrow 2}$
  - ▶ Two distributions over pairs of points  $x, y \in \{0,1\}^{\uparrow d}$ :
    - ▶ C:  $x = y + e_{\downarrow i}$  for random  $y$  and index  $i$
    - ▶ F:  $x, y$  are random
  - ▶ Two steps:
    - ▶  $E_{\downarrow C} [\|x - y\|_{\downarrow 1}] \leq O(1/d) \cdot E_{\downarrow F} [\|x - y\|_{\downarrow 1}]$
    - ▶  $E_{\downarrow C} [\|f(x) - f(y)\|_{\downarrow 2}^{\uparrow 2}] \geq \Omega(1/d) \cdot E_{\downarrow F} [\|f(x) - f(y)\|_{\downarrow 2}^{\uparrow 2}]$  (short diagonals)
  - ▶ Implies  $\Omega(\sqrt{d})$  lower bound!

# Other good host spaces?

- ▶ What is “good”:
  - ▶ is algorithmically tractable
  - ▶ is rich (can embed into it)

	sq-, etc
✓	✓
✗	✗

???

sq- $\ell_2$  = real space with distance:  $\|x-y\|_2^2$

Metric	Lower bound into
Edit distance over	[KN05, KR06]
Ulam (edit distance between permutations)	[AK07]
Earth-mover distance (-sized sets in )	[KN05]

sq- $\ell_2$ , hosts with very good LSH (lower bounds via communication complexity)

[AK'07]

[AK'07]

[AIK'08]

# The $\ell_{\infty}$ story

- ▶ **[Mat96]**: Can embed any metric on  $n$  points into  $\ell_{\infty}^n$
- ▶ **Theorem [I'98]**: NNS for  $\ell_{\infty}^d$  with
  - ▶  $O(\delta^{-1} \log \log d)$  approximation
  - ▶  $n^{1+\delta}$  space,  $\delta > 0$
  - ▶  $O(d \log n)$  query time
- ▶ Dimension  $n$  is an issue though...
- ▶ Smaller dimension?
  - ▶ Possible for some: Hausdorff, ... **[FCI99]**
- ▶ But, not possible even for  $\{0,1\}^d$  **[JL01]**

# Other good host spaces?

- ▶ What is “good”:
  - ▶ algorithmically tractable
  - ▶ rich (can embed into it)

	sq-, etc		
✓	✓	✓	✗
✗	✗	✗	✓

- ▶ But: combination sometimes works!

# Meet our new host

[A-Indyk-Krauthgamer'09]

- ▶ Iterated product space

$$sq-\ell_2 \uparrow \gamma (\ell_\infty \uparrow \beta (\ell_1 \uparrow \alpha))$$

$$x = (x_1, \dots, x_\alpha) \in \mathbb{R}^\alpha$$

$$d_1(x, y) = \sum_{i=1}^{\alpha} |x_i - y_i|$$

$$x = (x_1, \dots, x_\beta) \in \mathbb{R}^\alpha \times \mathbb{R}^\alpha \times \dots \times \mathbb{R}^\alpha$$

$$d_{\infty,1}(x, y) = \max_{i=1.. \beta} d_1(x_i, y_i)$$

$$x = (x_1, \dots, x_\gamma) \in \ell_\infty \uparrow \beta (\ell_1 \uparrow \alpha) \times \dots \times \ell_\infty \uparrow \beta (\ell_1 \uparrow \alpha)$$

$$d_{2,2,\infty,1}(x, y) = \sum_{i=1}^{\gamma} (d_{\infty,1}(x_i, y_i))^2$$

# Why $sq-\ell \downarrow 2 \uparrow \gamma (\ell \downarrow \infty \uparrow \beta (\ell \downarrow 1 \uparrow \alpha))$ ?

[Indyk'02, A-Indyk-Krauthgamer'09]

edit distance between permutations  
 $ED(1234567, 7123456) = 2$

▶ Because we can...

▶ **Embedding:** ...embed Ulam into  $sq-\ell \downarrow 2 \uparrow \gamma (\ell \downarrow \infty \uparrow \beta (\ell \downarrow 1 \uparrow \alpha))$  with *constant* distortion

▶ dimensions = length of the string

▶ **NNS:** Any  $t$ -iterated product space has NNS on  $n$  points with

▶  $(\log \log n)^{O(t)}$  approximation

▶ near-linear space and sublinear time

▶ **Corollary:** NNS for Ulam with  $O(\log \log n)^2$  approx.

▶ Better than via each  $\ell \downarrow p$  component separately!

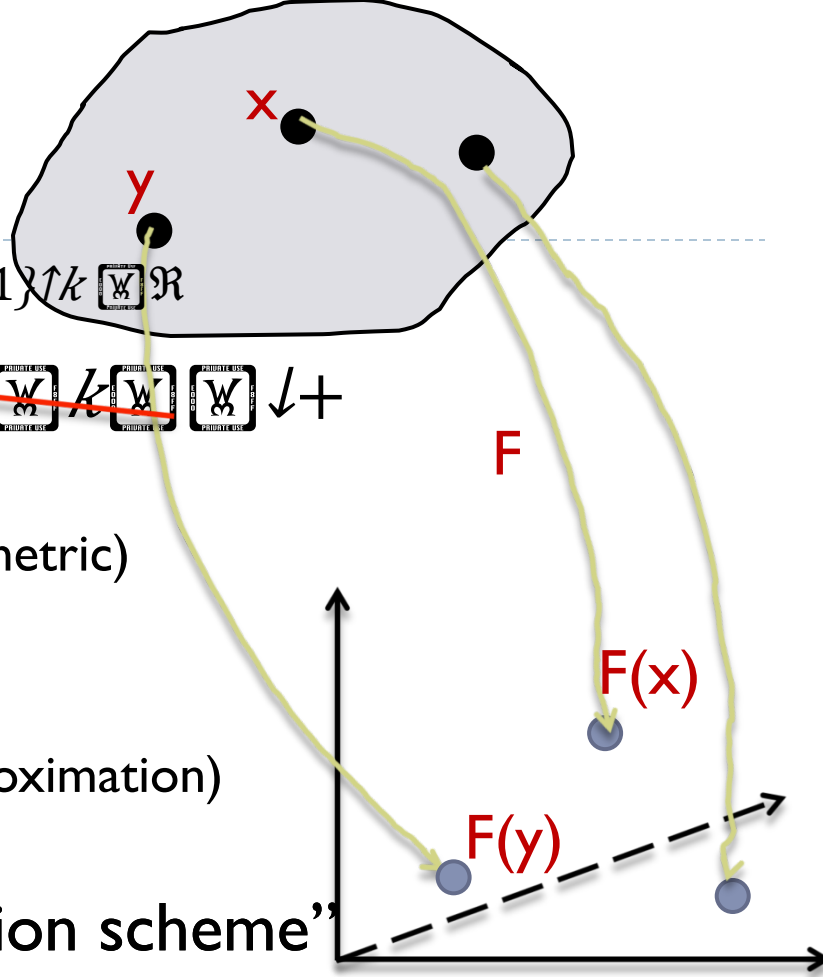

Algorithmically

Rich

tractable

# Sketching

# Computational view

- ▶  $F: M_{\mathbb{W}}^{\mathbb{R}^k} \rightarrow \mathbb{R}^k$   $\{0,1\}^k \times \{0,1\}^k \rightarrow \mathbb{W}^{\mathbb{R}}$
- ▶ Arbitrary computation  $C: \mathbb{W}^k \times \mathbb{W}^k \rightarrow \mathbb{W}^{\mathbb{R}}$
- ▶ Cons:
  - ▶ No/little structure (e.g.,  $(F, C)$  not metric)
- ▶ Pros:
  - ▶ More expressability:
  - ▶ may achieve better distortion (approximation)
  - ▶ smaller “dimension”  $k$
- ▶ Sketch  $F$ : “functional compression scheme”
- ▶ for estimating distances
- ▶ almost all lossy ( $1 + \mathbb{W}$  distortion or more) and randomized

$$d_M(x, y) \approx \sqrt{\sum}$$

$$C(F(x), F(y))$$

# Why?

---

- ▶ 1) Beyond embeddings:
  - ▶ can more do if “embed” into computational space
- ▶ 2) A waypoint to get embeddings:
  - ▶ computational perspective can give actual embeddings
- ▶ 3) Connection to informational/computational notions
  - ▶ communication complexity

# Beyond Embeddings:

---

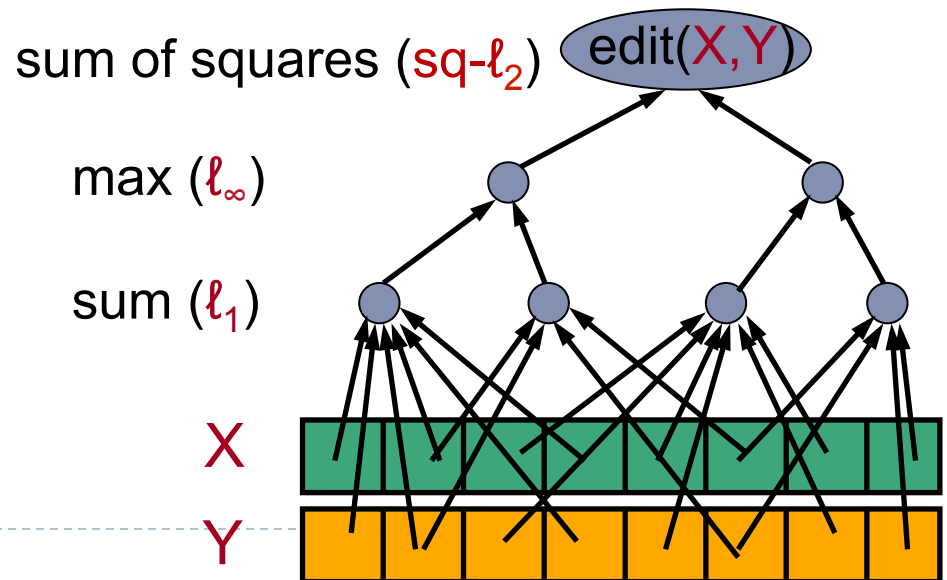

- ▶ “Dimension reduction” in  $\ell_1$  !
- ▶ **Lemma [IO0]:** exists linear  $F: \ell_1 \rightarrow \mathbb{R}^k$ , and  $C$ 
  - ▶ where  $k = O(\epsilon^{-2} \cdot \log n)$
  - ▶ achieves: for any  $x, y \in \ell_1$ , with probability  $1 - 1/n^2$ :
    - ▶  $C(F(x), F(y)) = (1 \pm \epsilon) \cdot \|x - y\|_1$
- ▶  $F(x) = (s_1 \cdot x, s_2 \cdot x, \dots, s_k \cdot x) / k = 1/k \cdot Sx$ 
  - ▶ Where  $s_i = (s_{i1}, s_{i2}, \dots, s_{id})$  with each  $s_{ij}$  distributed from Cauchy distribution (1-stable distribution)
  - ▶  $C(F(x), F(y)) = \text{median}(|F_1(x) - F_1(y)|, \dots, |F_k(x) - F_k(y)|)$ ,  $\text{pdf}(s) = 1/\pi(s^2 + 1)$
- ▶ While  $|s \cdot x|$  does not have expectation, it has median!

# Waypoint to get embeddings

- ▶ Embedding of Ulam metric into  $sq-\ell_2 \uparrow \gamma$  ( $\ell_\infty \uparrow \beta$  ( $\ell_1 \uparrow \alpha$ )) was obtained via “geometrization” of an algorithm/characterization:
  - ▶ *sublinear (local) algorithms*: property testing & streaming [EKKRV98, ACCL04, GJKK07, GG07, EJ08]

# Ulam: algorithmic characterization

[Ailon-Chazelle-Commandur-Lu'04, Gopalan-Jayram-Krauthgamer-Kumar'07, A-Indyk-Krauthgamer'09]

▶ **Lemma:**  $\text{Ulam}(x,y)$  approximately equals the number of “faulty” characters  $a$  satisfying:

- ▶ there exists  $K \geq 1$  (prefix-length) s.t.
- ▶ the set of  $K$  characters preceding  $a$  in  $x$  differs much from the set of  $K$  characters preceding  $a$  in  $y$

E.g.,  $a=5$ ;  $K=4$

$$|X[a; K] \Delta Y[a; K]| > K$$

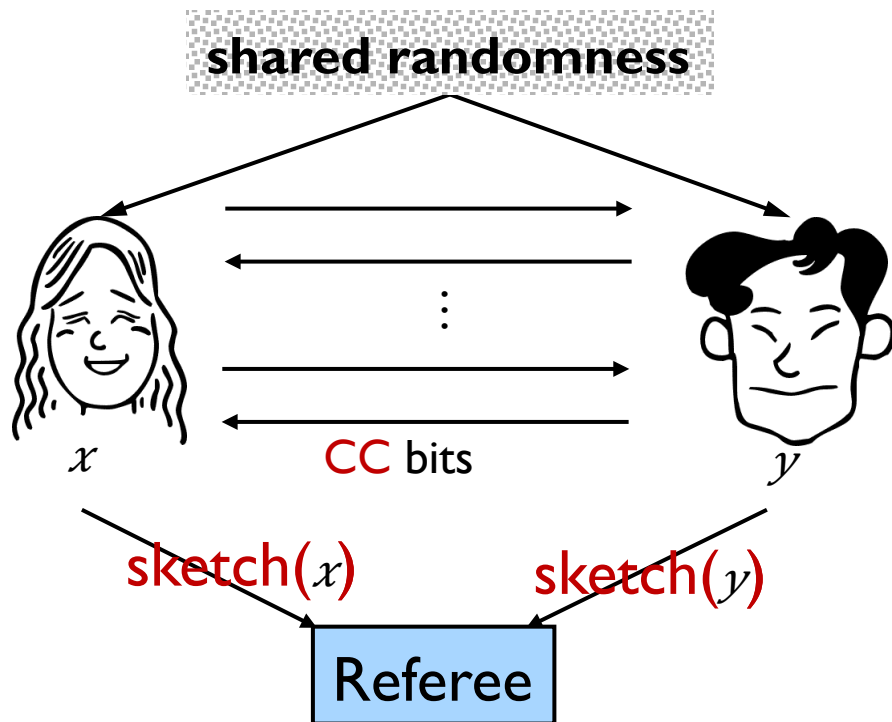

$$\| \mathbf{1}_{X[a;K]} - \mathbf{1}_{Y[a;K]} \|_1 > K$$

E.g.  $\mathbf{1}_{X[5;4]} = (1, 1, 1, 1, 0, 0, 0, 0, 0)$

# Connection to communication complexity

## ▶ Enter the world of Alice and Bob...

decide whether:

$$d(x,y) \leq R \text{ or } d(x,y) > cR$$

## Communication complexity model:

- Two-party protocol
- Shared randomness
- Promise (gap) version
- $c$  = approximation ratio
- $CC$  = min. # bits to decide (for 90% success)

## Sketching model:

- Referee decides based on  $sketch(x)$ ,  $sketch(y)$
- $SK$  = min. sketch size to decide

**Fact:**  $SK \geq CC$

# Communication Complexity

---

- ▶ VERY rich theory [Yao'79, KN'97, ...]
- ▶ Some notable examples:
  - ▶  $\ell \downarrow 1, \ell \downarrow 2$  are sketchable with  $O(1/\epsilon^2)$  bits! [AMS'96, KOR'98]
  - ▶ hence also everything that embeds into it!
  - ▶  $\Omega(1/\epsilon^2)$  is tight [IW'03, W'04, BJKS'08, CR'12]
  - ▶  $\ell \downarrow \infty \uparrow d$  requires  $\Omega(d/c^2)$  bits [BJKS'02]
  - ▶ Coresets: sketches of sets of points for geometric problems [AHV04...]
- ▶ Connection to NNS:
  - ▶ [KOR'98]: if sketch size is  $s$ , then NNS with  $n \uparrow O(s)$  space and one memory lookup!
  - ▶ From the perspective of NNS lower bounds, communication complexity closer to ground truth
- ▶ Question: do non-embeddability results say something about non-sketchability?
  - ▶ also Poincaré-type inequalities... [AK07, AJP'10]
- ▶ Connections to *streaming*: see Graham Cormode's lecture
